No part of this publication may be reproduced, in any form, without the written consent of the publisher. FORMAT readers may copy program material only for their own personal use. While every effort is made to ensure accuracy in FORMAT the publisher will not be held liable for any errors or omissions.

FORMAT is published by INDUG. 34 Bourton Road, Gloucester, GL4 0LE, England. Telephone 0452-412572. DISCIPLE and PLUS D are trade marks of MILES GORDON TECHNOLOGY plc. Lakeside Technology Park, Phoenix Way, Swansea, South Wales, SA7 9EH. Telephone 0792-791100.

Printed by D.S.LITHO. Gloucester. Tel:- (0452) 23198.

Following my request, a couple of months ago, for ideas to expand the readership of FORMAT, I have still only received a handful of letters. Now remember the estimate of the number of Spectrum users who would benefit from FORMAT was 150,000 (10% of the 1.5 million Spectrums in circulation). It appears to be the norm that each copy of FORMAT is read by at least two people and I know of several cases where its many more than two. Now if only half those people were to buy their own copy FORMAT could be 40-50% larger, that could mean an extra 16 pages a month.

Right, so if a bigger FORMAT is not incentive enough to persuade you to get your friends to buy their own copies, lets make you an offer you can't ignore.

**EXTRA Copies of FORMAT
and
The Chance to WIN ££££££**

With this issue you will find a special subscription form for you to give to your friends, you can photocopy it as many times as you like or ask us to send you some more copies. Simply fill in your membership number and details in the space provided, then hand it to your friend. When your friends membership has been processed by us we will add an extra month to your own subscription and send you a draw ticket. That's 1 EXTRA months FORMAT and 1 Draw Ticket for EACH new member you introduce.

So what's the draw ticket for? Well until the 31st December 1989 we'll be running a SPECIAL FUND where the ££££££ will be mounting up. For every new member introduced on the special form

we will add 50p to the fund. So for each new member you introduce you get a draw ticket and a chance to win this POT of gold.

Thats right, the LUCKY WINNER will receive a cheque for the TOTAL VALUE of the fund. What's its going to be worth? Well thats up to you. The more new members, the more money in the pot. And the more new members you introduce, the more chances you have to WIN.

So now you have several very good excuses for introducing your friends (or even strangers) to FORMAT.

Now on to other things, this is the largest issue we've published so far - a full 36 pages. Not bad! especially when you remember that the U.K. membership rate has remained unchanged since we started, way back in 1987. Which leads me onto next months EVEN BIGGER ISSUE. Yes - our 2nd Birthday Issue, lots of very special things - dont miss it.

Still on the subject of size, I have had several letters, and quite a few phone calls, pointing out that last months FORMAT was even bigger than the July issue of Crash. What are they doing at Crash?

Finally, a request for information. We are going to compile a directory of companies who repair Spectrums and/or peripherals. If you know of a company, or better still if you have experience (good or bad) of the service a repair company gives, drop us a line with details.

Bye for now.

Bob Brenchley. Editor.

NEWS ON 4

NEXT IS GONE.

CEEFAX, the BBC teletext service, has dropped its micro magazine NEXT. Page 701 on BBC 2 has long been the page for computer fans to turn to. But on Friday 30th of June NEXT came to an end. No explanation was given and my contact at the BBC was unable to find out why NEXT had received the chop.

TWO NEW SHOWS

Two new 'Multi-Format' shows have been announced. The Spring Computer Show will be held at Olympia in London from 4th to 6th of May. Aimed at home and education users the show is being organized by Focus Events part of the group that publishes Popular Computing Weekly.

The Computer Shopper Show is another new show this time scheduled for the autumn. Set for November 24th to 26th 1989 it will be held at Alexandra Palace. The show is organized by Database Exhibitions who used to put on the Amstrad, Commodore, Acorn and Atari shows (which the new show will replace). Entry will be £4 for adults, £3 for under 16s, which seems a bit expensive for a home computer show.

DIXONS AND THE +2A

A mole at DIXONS indicates that sales of the +2A computer have caused major problems. With software and hardware compatibility problems many people are returning the machines believing they are faulty. If you buy a computer that says its a Spectrum +2 on the box, that looks like a +2 (just a little darker), but wont run your wordprocessor or even some of your game - what would you do? Our source also hinted that they were hoping to obtain stocks of the old +2 soon.

£5m OFF SCHOOL COMPUTERS.

No, its not the sale of the century, its a disaster for our kids education. Spending on information technology in schools has been cut by 5.5 million (from £14 to £8.5 million).

MICROPROSE BUYS TELCOMSOFT.

Microprose is reported to have paid around £2 million for the software division of British Telecom. The deal includes the entire operation, from budget label SILVERBIRD to top of the range RAINBIRD. It is unclear where the company will now base the Telecomsoft operation.

HACKING ACTION.

Emma Nicholson MP lost in her bid to make computer hacking (gaining entry to computer systems without permission) a criminal offence. Her bill failed due to lack of time. But the government have promised to look at taking action later this year.

LOW COST 24 PIN PRINTER

Citizen have announced a new 24 pin dot-matrix printer for under £400 and called the SWIFT 24. Four different fonts included as standard (with extra available as plug in cards) the printer has a claimed speed of 160 characters per second in draft or 53cps in letter quality. Like many quality printers these days it includes nice features like Paper-Parking, the easy way to use both sheet and tractor feed paper on the same machine. The printer is compatible with Epson, IBM and NEC P6 standards.

If you have any news items you want to pass on then send them in. Please mark the envelope NEWS in the top corner.

OMNICALC 2

TO
DISC

By: Japp Kuiper.

In a previous issue of FORMAT there were some loose remarks regarding OMICALC2. Unfortunately, I'm sorry to say, these were of precious little help. But I hope with this article to provide some real solutions to getting the program working with DISCIPLE & PLUS D disc systems.

Sadly though, the Transform conversion of OMICALC2 for the DISCIPLE / PLUS D, as sold by both Transform and MGT, is a bit of a sob-story. Primarily this is the Opus Discovery version copied to a GDOS format disc. Therefore, it only works for (a single) drive one. In addition there are no CATalogue and no ERASE. Furthermore a new feature has been completely omitted and some vital information has simply been withheld.

Now for the good news. Firstly copy your original tape version of "om2" to disc. There are plenty of good tape to disc copiers around to assist. Do NOT, however, save it to disc as an Autoload file nor as a Snapshot file. Secondly RESET your Spectrun. Thirdly enter the following small program:-

```
10 POKE 4e4,207: POKE 40001,49: POKE
    4002,201
20 RANDOMIZE USR 4e4
30 LOAD d*"Omnicalc2"
    (or whatever name you saved it as)
```

Then save to disc by:-

```
SAVE d1"AUTOLOAD" LINE 10
```

You will now find Omnicalc2 to perform as if it were running from Interface One as originally intended. In other words almost entirely as per the original manual. It will happily LOAD, SAVE, VERIFY, CAT, ERASE to and from channels 0, 1 and 2 for tape, drives 1

and 2 respectively. (The latter two on channels 1 and 2 only for obvious reasons). PRINTing Histograms is different in that this only works through SNAPSHOT 1 and 2. Snapshot 3 being an extra bonus.

THE SECRET

When LOADING OMNICALC2 (and a few other programs for that matter) it "looks" for the presence of Interface One by checking the start of the Basic area in RAM. Normally this is at 23755, try this line to prove it:-

```
PRINT PEEK 23635+256* PEEK 23636
```

The three bytes of machine code in the new LOADER program raise the start of the Basic area to address 23813. We thus "fool" OMNICALC2 in believing Interface One has been connected and the program from then on acts accordingly, unlocking it's Interface One features.

Since the DISCIPLE and PLUS D are ever so kind in understanding Microdrive Syntax the program now runs and operates entirely as if Interface One were hooked up to our Spectrum.

RESCUE CALLS

Disc drives have a habit of invoking error messages such as Write Protected, Disc Full, Check Disc In Drive (when you forget to close the drive door) and what have you. All these messages drop you into Basic. You can now stop cursing yourself when such an error occurs prior to saving a complicated model. A choice of two special user calls comes to the rescue. Firstly try:-

```
RANDOMIZE USR 63081
```

This should successfully throw you back into OMICALC2. Depending on the type of error message generated, no 100% guarantee, however, is given and you therefore should check for any corruptions. I have myself forced some errors and found no damage was done to my model. An additional recovery path is by:-

```
RANDOMIZE USR 57131
followed by G(oto) al.
```

All the above mentioned hints and tips will also hold for the Transform disc version of OMNICALC2. Owners of such a disc should type in the line:-

```
ERASE d*"Autoload" TO"OMNI2"
```

and then proceed as outlined above. They can also ignore the Opus addendum sheet and go by the book as far as normal operations are concerned. The one and only good thing about the Transform version is that the initial waiting has been taken out of the program. It now does not perform a long search for the presence of Interface One anymore but simply assumes its there and liberates CAT and ERASE for our perusal.

FUNCTION Z

The added function Z is a bit of a joke. Option P for printer control is the only valuable addition. It allows us to switch from within OMNICALC2 between PICA, ELITE, CONDENSED MODE etc. This is a very useful addition when we want to print large models with many columns. Microsphere, the original designers of OMNICALC sells (or at least used to sell) a very clever converter program.

By checking the Transform disc against this program I found Transform used this very conversion method to produce their DISCiPLE / PLUS D version of OMNICALC2. As previously mentioned they did a sorry job.

If you have an original OMNICALC tape you will do yourself a favour in obtaining the original conversion tape. This will set you back about a fiver.

The conversion program allows you to custom design your very own Function Z. My implementation of a decent Function Z goes as follows:-

```
1 CLS: PRINT AT 10,3;"REMEMBER TO S
AVE DATA/WORK": PAUSE 0: IF INKEY
$<> CHR$ 7 THEN RANDOMIZE USR 0
2 LOAD d1"formprint"CODE 23296;RAND
OMIZE USR 23296
3 LET c=z etc.
10 REM Exit/Formulae/Print
```

OMNICALC2 lacks a decent way to quit. The INKEY\$<>CHR\$7 bit will allow you to correct a fatal error by pressing the EDIT key as used throughout this program. Nothing wrong of course in replacing the USR 0 with LOAD d1"Tasword" and add a further line of Basic along the same lines to go into Masterfile. Software Integration at its best.

Since you can have up to 10 lines of Basic there is plenty of scope. Line 3 contains the printer control. Little point in quoting this particular line here in full, since it is fully outlined in the instruction sheet which accompanies the converter tape. If you do decide to add Tasword and Masterfile in lines 4 and 5 line 10 will look like:-

```
10 REM Exit/Formulae/Print/Tasword/M
asterfile.
```

FORMULAE

On the tape is also an extremely useful block of machine code which will print the formulae which you used in your model. It will happily live in the printer buffer so no need to use the reduced version - om64000 - of OMNICALC2. Simply copy this block of machine code to disc and include the above mentioned line 2 of Basic to invoke it from within OMNICALC2 through function Z, option F.

SNAG

Nothing is perfect and neither is OMNICALC2. The program, although

Turn to page 30.

SHORT • SPOT

By: John Wase.

Roy Slade of Barnstaple writes that he has a quick routine to explain the funny money abroad - he refers to the daily newspaper just before he leaves, inserts the conversion rate, and does half a dozen screen dumps with the snapshot button (some to give away). He encloses lots of examples - here are just two:-

Example 1

```
5 POKE @5,40
10 INPUT "Enter Conversion Rate";r
30 LET z=r
40 PRINT INVERSE 1;" Conversion Rate
   ";z;" "
50 PRINT "Francs £"
60 DEF FN b(y)=(INT (100*(y/z)+0.5))
   /100
70 FOR k=5 TO 100 STEP 5
80 PRINT TAB 3-LEN STR$ INT k;k,TAB
   1 8-LEN STR$ INT FN b(k);FN b(k)
90 NEXT k 100 PRINT AT 11,7;"FRANCE"
```

Example 2

```
5 POKE @5,40
10 INPUT "Enter Conversion Rate";r
30 LET z=r
40 PRINT INVERSE 1;" Conversion Rate
   ";z;" "
50 PRINT "Lire £"
60 DEF FN b(y)=(INT (100*(y/z)+0.5))
   /100
70 FOR k=1000 TO 20000 STEP 1000
80 PRINT TAB 5-LEN STR$ INT k;k,TAB
   1 9-LEN STR$ INT FN b(k);FN b(k)
90 NEXT k 100 PRINT AT 11,7;"ITALY"
```

Ian Spencer of West Germany writes about Word Master. Like me, he's not particularly taken with some of the letter shapes displayed on-screen, for example "M" or "W", so he's altered them as follows: he says that his are easier to read. Do CLEAR 30000, then load WM. Now get into Basic and write

a small program to poke the character set as follows (8 bytes per character)

=====		
Char Address Values		
=====		
%	64552	0,0,68,85,34,85,17,0
*	64592	0,0,85,34,119,34,85,0
4	64672	0,17,51,85,85,119,17,0
K	64856	0,85,85,102,102,85,85,0
M	64872	0,85,119,119,119,85,85,0
N	64880	0,119,85,85,85,85,85,0
V	64944	0,85,85,85,85,85,34,0
W	64952	0,85,85,119,119,119,34,0
a	65032	0,0,119,17,119,85,119,0
l	65120	0,102,34,34,34,34,119,0
m	65128	0,0,85,119,119,85,85,0
q	65160	0,0,119,85,119,17,17,0
v	65200	0,0,85,85,85,85,34,0
w	65208	0,0,85,85,119,119,85,0

Note:- The letter starting at 65120 is the lower-case L.

And finally end with SAVE "WM" CODE 54174,11362. Ian mentions that of course, letters like "M" and "W" are still a compromise, but that he finds that this gives a considerable improvement in readability.

I was intrigued by Mr J.J.Farrel's letter, which came down from the Wirral with some jottings for a program called "The bluebottle that should have stayed at home". Regrettably, with a lovely name like that, I couldn't get it to work properly - could he please forward a tape or disc with a working copy?

L.G.Baumann of Cowie's Hill, South Africa, writes about INKEY\$. The advantage of this function is that you can get an immediate response without having to press "Enter": the disadvantage is that only numbers from

0 to 9 are available. However, the use of two digits is possible with the following routine:-

```

10 FOR N=1 TO 9: PRINT "0";N: NEXT N
20 FOR N=10 TO 22: PRINT N: NEXT N
21 PRINT AT 21,10;"Choose No.? ";
30 PAUSE 0: LET M$=INKEY$: BEEP .2,2
  O: PRINT AT 21,25;M$
40 PAUSE 0: LET N$=INKEY$: BEEP .2,2
  O: PRINT AT 21,25;N$
50 LET M$=M$+N$
60 IF VAL M$<1 OR VAL M$>22 THEN GOT
  O 30
9999 CLS: PRINT "Objective accomplishe
  d - No.";M$

```

Next, Robin Hughes of Ebbw Vale encloses this neat little routine. How do you buy discs? Normally you buy at least ten (they're dear then) or even fifty or a hundred at bulk rate. The first thing you have to do is format them and usually you want the system code on, too, so here's his bulk format program.

```

0 REM "FORMAT" v1.1 ROBIN HUGHES 19
  89
10 CLS #: PLOT 38,64, DRAW 0,40: DRA
  W 180,0: DRAW 0,-40: DRAW -180,0
20 PRINT AT 10,6; FLASH 1;"WARNING T
  HIS PROGRAM": PRINT AT 12,8; FLAS
  H 1; "WILL ERASE DISC"
30 GOSUB 2000
40 PAPER 1: BORDER 1: INK 7
50 CLS : PRINT AT 10,8; FLASH 1;"FOR
  MATTING DISC"
60 FORMAT D*
70 CLS : PRINT AT 10,9; FLASH 1;"SAV
  ING SYSTEM"
80 SAVE D*"+SYS"CODE 8192,6656: CAT
  *
90 PLOT 50,65: DRAW 0,36: DRAW 140,0
  : DRAW 0,-36: DRAW -140,0
100 PRINT AT 10,8;"DISC FORMATTED": P
  RINT AT 12,8; FLASH 1;"LOAD NEXT
  DISC"
110 GOSUB 2000: GOTO 50
2000 PRINT #0;" PRESS ANY KEY TO CONTI
  NUE"
2005 BEEP .1,18: BEEP .1,16: IF INKEY$
  ="" THEN GOTO 2005
2010 RETURN
9999 SAVE D*"FORMAT" LINE 0

```

If you've got a Disciple, then modify line 80 for the Disciple system

thus:-

```

80 SAVE D*"SYSTEM" CODE 0,6656: CAT
  *: REM EARLY DISCIPLES USED CODE
  0,6144

```

Finally, I am grateful to Trevor Wright of Melton Mowbray for his little booklet of bits and pieces. One point mentioned is the use of the system variables in programming. So if you have a program which displays, say a program name on screen before saving it to disc from backup tape, the last thing you want is for the whole shooting match to stop with the message "Scroll?". Poking 23692 with 255 will give you 256 scrolls - set it up as a loop in the program if you want more than that.

Another similar idea is to set Caps Lock on automatically from within the program before asking for information; say with INKEY\$. Saves testing both for caps and lower case input. For example "PRINT "FORMAT DISC (Y/N)?: POKE 23617,8: IF INKEY\$ =....."

As a tailpiece, here is an adaptation of one of his snippets. If you were to go into your local computer shop (you must not, of course, do this) and enter the following into one of their display Spectrums:- PRINT "INDUG IS THE BEST USER GROUP": RANDOMIZE USR 1000 the border would turn black (Speccy's dying!) and the keyboard would lock solid, so there it would all stay until they reset or pulled the plug. As an alternative, you could, of course do "John Wase is the greatest!".

Now please; I know it's the holiday season soon, but please keep the contributions rolling in. Send your items direct to me at:-

John Wase,
Green Leys Cottage,
Bishampton,
Pershore,
Worcs,
WR10 2LX.

See you next month.

T.V. TEST CARDS

On Your Spectrum.

By: Dick Guy.

This program was written to assist in setting up televisions after repair, however it you will find it very useful for fine-tuning your T.V. so as to get the best picture from your Speccy (a computer not renowned for the quality of its T.V. output).

When you RUN the program you will be given a menu of five different options.

- 1 TEST CARD 1
- 2 TEST CARD 2
- 3 COLOUR TUNING CHART
- 4 LINEARITY TEST
- 5 OVERALL COLOUR TEST

Just press a numeric key to select an option.

Anyone familiar with T.V. testing will be right at home, but for those of you who are not here are a few brief hints.

Options 1 & 2 give test cards that are used for fine-tuning your picture, switch between them if you need to. They are based on test cards used by many television stations around the world.

Option 3 is a colour bar generator with alternate lines set with bright on.

With option 4 lines are drawn to enable you to set screen linearity. The aim is to ensure that lines are straight and the same distance apart. Not an easy job, so if your set is way out it may be best to have it looked at by an expert.

Option 5 sets the whole screen to each colour in turn, just press a key to change to the next colour. This

option can be used to check for many faults on a T.V. look for changes of colour in the corners or centre of the screen.

The program is simple to type in, graphics are show by their key presses enclosed in {}. So {GS 5} means - enter Graphics Mode - press Shift and 5 - for more details see EASY READ in FORMAT Vol 1 No 10.

LUNAR CALENDAR

By: Jason McNeal.

The Moon has always held a fascination for mankind, since the dawn of time it has been the largest object visible in the night sky. As man struggled along the road to civilization he has often turned to the Moon and worshipped it as a god. Early man tried to understand and explain the waxing and waning process the Moon goes through every 29 days. Were the other gods eating away at the Moon? Remember that Stonehenge was built (over a period of generations) to predict Lunar and Solar eclipses, this proves the importance of the Lunar Calendar to our ancestors.

Well we now understand the phases of the Moon, the mystery is gone, and now even you Spectrum can produce a Lunar Calendar for you. The program will run on any Spectrum but it will need a printer to get the maximum benefits.

To simplify the calculations the calendar can only be produced for months in the years 1950 to 2050. The example given (top of page) is for August 1989. From this you will note that the phases between the 2nd and 16th of the month have their dates printed normally, this shows the Moon is WAXING - moving from NEW to FULL. The other dates are shown INVERSE to indicate that the Moon is WANING - going from FULL to NEW. The actual NEW and FULL Moons occur at the change over.

Now, if you want to plan that Moonlight walk along the shore with the love of your life, you can at least arrange a date when the Moon is big and bright (provided the clouds don't get in the way that is).

THE HELP PAGE

Problems with your DISCiPLE, PLUS D or Spectrum. Dont worry, let the HELP PAGE sort them out. Note: One question per letter please.

By: Nev Young.

P Clough of Durham writes and asks "Is it possible to drive a laser printer from a Spectrum and a PLUS D".

First I feel I must climb onto an orange box and correct all FORMAT readers on laser printers. The term laser printer is rapidly becoming a misnomer. There are printers that use a laser to produce an image on the paper, but what most people mean when they say laser printer is 'page printer'. These work on a number of different technologies. Some use lasers (and generally CFCs), others use magnetic inking but most use xerography. All have one thing in common and that is an entire page of data is sent to the printer before anything is printed. Therefore the correct name is page printer.

Now to use a page printer with the Spectrum via a PLUS D can be done but there are a few points to watch out for, and considering that a page printer will cost at least £1150.00 they must be considered very carefully. The first is the interface, there are mainly two types serial (RS232) and parallel, you need parallel and centronics parallel at that. Secondly there are postscript printers and there are non postscript printers. You definitely do NOT want a postscript printer with the PLUS D. Can you afford 1.2 - 5 pence per page printing. Then you have all the same problems you would have when buying any other printer such as: Is it EPSON compatible. If not can the Spectrum supply the correct control codes. What fonts does it have. What character sets etc etc. I think your biggest problem would be getting EPSON graphics compatibility which you would most certainly need to print your fancy letter heading.

J V Ingram of Dunedin New Zealand has a problem with Masterfile in that he can not get a printed copy of the records. Now I am not a fan of Masterfile I find it very difficult to set up and add/change data in the files but the reporting facilities are quite good, although a bit too much like MAPPER for my taste. My own copy of Masterfile is quite old and written for microdrive but it sounds as if you have the same problem as I did when using the DISCiPLE. Masterfile does all it's printing via the basic COPY command. This does not work with the DISCiPLE and PLUS D because of a bug with the 128s ROM. So you have to replace the COPY command in the basic with SAVE SCREEN\$ 1. You should now be able to get all the Masterfile print functions to work. As for your other problem about an alternative program that makes better use of the disc then I'm sorry I don't know of any that have reached the market but I am aware of at least two that are being produced. I can only suggest that you keep an eye on the advertisement pages.

J Husband of Cleveland is "amazed at how quickly the ribbon faded." on his DMP2160 printer. You should be annoyed not amazed. If you really want to try re-inking your ribbon then be prepared for a messy time. I have done it quite successfully a few times on my own Mannesman Tally ribbons. You will need a small bottle of endorsing ink, The type used for inking rubber stamp pads, and an old ribbon cassette. You will need to break open the cassette to expose the ribbon. Take care here as if it all falls out you may as well throw it away. Then apply a few drops of ink to the crumpled mass of ribbon inside. Believe me a few drops goes a long way. If you've not got enough on

add more but please do not over do it. If there is too much ink then as the ribbon passes through the print head of the printer it will get squeezed out and make a dreadful mess, when I first did it I had ink all over the printer, the desk and dripping onto the carpet. After a few tries you'll get good at it. I don't suppose I need to tell you to re-assemble the ribbon before trying it.

I have had a number of letters about disc drives and the compatibility between different types. I am reluctant to open this Pandoras box as there are so many different questions and not always the same answer applies to each. I will have to keep this fairly simple so don't be offended if your question is not answered here. Will programs written for the DISCiPLE/PLUS D work on a +3?

If the program only uses the disc to load and save programs/data then yes it will, with the proviso that some lines of the basic will need to be changed. If, however, the program does anything dastardly like reading or writing the directory (eg by using LOAD@ or SAVE@) then NO it will not work. Also if the disc is driven from machine code then it will probably not work, as the machine code interface to the discs is different. This does not mean that a program couldn't be written to the the same task, just that it would not be a few simple changes.

Can you drive an OPUS Discovery from a DISCiPLE? This depends on what you mean by drive. You can connect the DISCiPLE onto the Discovery through connector and with a bit of fiddling with the inhibit button get both to work to enable you to copy stuff from Discovery to DISCiPLE. But if you want to run the Discovery disc drive as a DISCiPLE drive then you have to break open the discovery and disconnect the drive from the internal circuit board. Then connect the disc drive to the DISCiPLE via a standard BBC type ribbon cable, and leave the Discovery disconnected from the Spectrum and DISCiPLE edge connectors. The

Discovery power supply would not be used to power the Spectrum just the disc drive.

Why is that whenever I try to format a disc I get the message 'check disk in drive 1' Even with a different Spectrum/PLUS D/disc drive?

This error means that the PLUS D can not find any disc in your disc drive so the things to check are:-

1. Is there a disc in the drive.
2. Is the disc inserted correctly. Remember a 5 1/4 inch disc can be put into a drive 8 ways, only one is right.
3. Is the drive address set up correctly. This one is tricky and requires either a disc manual or a friend who KNOWS what they are doing. The PLUS D is able to run 2 drives and each drive can be addressed 1,2,3 or 4. Your first disc drive must be address 1 and the next address 2. If you have a LED on your drive then you can tell when it is being addressed by the light coming on. So a quick check is connect everything together, switch on, press RUN and ENTER. The light should go out on the PLUS D and the light on drive 1 should come on.

Finally this month E H Cooke-Yarborough of Oxfordshire is having problems with error trapping as described in FORMAT #4. He sent in the following short routine.

```
100 POKE 23728,255
110 CIRCLE 120,50,100
120 POKE 23728,0
130 POKE 23610,255
140 CIRCLE 120,50,40
150 RETURN
```

He points out this should, and indeed does, draw an incomplete circle that goes off the screen followed by a smaller one. But when the RETURN statement is executed the Spectrum hangs. Well Ted you are right about the stack being corrupted by the disciple. When you start your program with GOSUB 100 the last value on the

stack (1303H MAIN-4) is moved down by 3 bytes to store the line and statement number where the gosub was called. In this case statement 1 (02) line -2 (FFFEH a direct command) so the stack will now hold 003EH FFF02H 0313H . When the command on line 110 is executed a value of 1B76H is put on the stack (stmt-ret) followed by various other values used by the CIRCLE command. There are about 10 bytes of this temporary stack data when the circle goes off the screen and tries to report Integer out of Range. When the disciple traps this and returns to the main rom to execute line 120 it does not clear these extra bytes from the stack.

In this way everything will work OK even if the program is stopped with a STOP or BREAK but if a return is done the top value on the stack is now NOT 0313H followed by the gosub parameters but the temporary data of the unfinished circle. This causes the Spectrum to either crash or hang as it attempts to jump to totally the wrong line. What should have been done is to reload SP with (ERRSP) before jumping to execute the next line. The bug is at about 06EFH in the disciple dos. I'll let somebody else work out the pokes to fix it. While it exists it does mean that using the error trap within a subroutine can be unreliable.

Thats all for this month. Remember If you don't write to me I can't write this column. I also have to point out that I can not answer questions personally so DO NOT send me return postage etc. I will attempt to answer as many queries as possible but only through the magazine. Write to FORMAT or directly to me at:-

FORMAT Help Line,
3, Mitchell Place,
Falkirk,
Stirlingshire,
Scotland, FK1 5PJ.

PCB DESIGNER

FOR THE 48K ZX SPECTRUM

Now you can produce high quality printed circuit boards/circuit diagrams/component layouts on your 48K ZX Spectrum. If you don't own one it's worth getting one just for this suite of programs! *Comprehensive manual included with getting started tutorial.*

FULL SUITE FOR ONLY £30.00 INC.

PCB LAYOUT:

Produce quality printed circuits directly from your EPSON RX/FX or compatible dot matrix printer using a dense 1:1 printout on positive photoresist coated board. Or super quality using x2 printout and photoreduction. Many features such as 15 track widths; 15 pad sizes; 16 transistor/corners; 20 connectors; large multiscreen WYSIWYG display gives a clear uncluttered view of pads, tracks and drill holes; 0.1in. grid on/off; Block move; copy; mirror; rotate;erase; area fill (ideal for earth plane); preview; undo; dimensionally accurate printer routine with quick print; 1:1 or 2:1 dumps. Custom pad design and library. Available separately for £20.00 inc.

COMPONENT LAYOUT

Draw component layouts directly or from existing pcb layouts using a unique track reducing facility. The following components are provided: resistors, capacitors, ics, diodes, transistors, line drawing, printout and block commands as above. Not available separately.

CIRCUIT DIAGRAMS

Features similar to the above programs with a library of electronic symbols including resistors, capacitors, diodes, transistors, ics, op amp, switches, inductors, logic gates. Not available separately.

State version required from: Disciple/+D; Discovery; +3; Microdrive & Tape. *Important! Tape and Microdrive users please state Centronics interface in use or send £1 for details.*

KEMSOFT THE WOODLANDS, KEMPSEY,
WORCESTER WR5 3NB. Tel. 0905 821088 after 6 p.m., or
see us on A.I.X-386 BULLETIN BOARD 0905 52536/754127
on any computer with modem.

BUSINESS AND PLEASURE

The MGT Lifetime Drive. A Citizen 1Mbyte 3½" drive with its own power supply. Works with your DISCiPLE or PLUS D. Also works with your Q.L., Amiga, ST, BBC or even PC! All you change is the cable and switches. A lifetime of business and pleasure!

Lifetime Drive.....£129.95 inc VAT
Spectrum/BBC Cable£10.00 inc VAT
All other cables (each).....£18.50 inc VAT
Shipping charge£4.50

Spectrums in the LIBRARY.

PART 2.

By: Carol Brooksbank.

This month, I want to tell you about the Library's stationery supplies. Any library, however small, needs a variety of different stationery items. We use:-

- Borrowers' tickets
- Issue forms
- Application for membership forms
- Book plates
- Book reservation forms
- Book labels
- Book recommendation forms
- Overdue book letters
- Opening hours & rules lists
- Catalogue order forms
- Catalogue covers
- Notices and posters
- Headed notepaper
- Withdrawal labels
- Petty cash accounts (Filofax format)

Although there are a range of different items, we only need each item in small numbers. For instance, we use one issue form each time the Library is open, to note the book numbers against the members' numbers for books returned and taken out. The information is later transferred to the computer files. Since the Library opens once a month, a year's supply of these forms is just 12 copies.

If we were to have these printed professionally, we should either have to accept an enormous unit cost, or keep stocks which would last us, quite literally, for decades. Either way, it would be a crippling burden on our limited funds, tying up far too much of our capital in printed material.

By using the Spectrum+2, with a PLUS D, 3 1/2" drive and an Epson printer, for printing, we can reduce our main stationery stock to 1 box of 1000 sheets of tractor-feed A4 paper,

and one box of 1000 peel-off labels - a capital outlay of £20. All of the layouts for the various items are kept on disc and they can be run off as required. In practice, I tend to run off about a dozen of each item at a time, so we have a stationery printing session once a year.

One-offs like notices and posters are produced as needed. Book plates and labels are printed every time we buy a batch of new books - usually four times a year. Headed notepaper is produced as required - I print the heading on enough sheets for today's letters. Many small businesses would probably want to keep a separate box of headed notepaper, printing the heading on each sheet, but the Library generates very few letters - certainly not enough to justify tying up a full box of paper as headed notepaper.

I use 5 commercial programs for preparing printing screens:-

- The Artist II (128K)
- The Artist (48K)
- The Writer (48K)
- Icon Graphix 128 (128K)
- Animator 1 (48K)

Thanks to the PLUS D disc capacity, I have all of these on one disc, so that I can easily save a part-designed screen and go from program to program to add to it, exploiting the best features of each program.

The principal program is THE ARTIST II. Since most of our forms are to be A4 size, the Pagemaker feature of this program is ideal. It uses eight full screens together to produce an A4 printout, which allows a fair amount of detailed work to be used. In addition, if text is required, it can

be prepared using THE WRITER word processor. Control codes can be inserted to select the Pagemaker typefaces, and spaces left to incorporate illustrations. Fig 1, our rules and regulations, shows a page produced using text and diagrams.

Smaller items, such as book recommendation slips, can be produced four to a sheet of A4, by designing just two screens and inserting each into the Pagemaker four times. Our borrowers' tickets (Fig 2) and applications for membership are smaller still (1 screen each) and printed eight to the page.

Although it has officially been replaced by THE ARTIST II, I still find THE ARTIST useful because it is the only one of the programs which offers an arc between two points, with a variable depth of curve. Fig 3 shows just a few of the arcs available between two points, and some effects obtainable with curves.

ANIMATOR 1 is very good at manipulating type faces. I have discovered that by slightly changing the ARTIST II typeface code blocks and re-saving them, they can be loaded into ANIMATOR 1, and enlarged, mirrored, and so on very easily.

ICON GRAPHIX must be the slowest graphics program on the market. Its cursor creeps about at snail's pace and the fill speed is ridiculous, but the program does have its own strengths. It has a particularly good range of large type faces (Fig 4). They cannot be loaded into the other programs, but they are invaluable for posters and notices. Also, it has a better range of fill patterns than either of the other programs, and

COVENTRY DIOCESAN READERS' LIBRARY

The Library is housed at the Parish Church of All Saints, Leamington Spa, on the mezzanine floor reached by the gallery staircase.

CENTRAL LEAMINGTON SPA

ALL SAINTS' CHURCH, WEST END

OPENING HOURS

Open on the first Saturday of every month 12-4p.m. MAR-NOV 12-2.30p.m. DEC-FEB. N.B. It can also be opened on a Sunday morning between approx. 11.45a.m. and 12.30p.m. (after the main Eucharist), but please phone the Librarian beforehand to arrange for it to be opened if you wish to visit the Library on a Sunday.

Coffee is usually available in the Unquhart Room until 12.30p.m. on Saturday and Sunday mornings.

CATALOGUE

Copies of the Library catalogue can be ordered from the Librarian, price £1.50 each.

BORROWING BOOKS WHEN THE LIBRARY IS NOT OPEN

If the opening hours are not convenient for you, list the catalogue details of the books you require on the application form and send it to the Librarian. As soon as they are available, you will be notified that they are at the collection point you specified on the form.

RETURNING BOOKS

Please return books as soon as you have finished with them, as our stock is small and other Readers may require them. If you cannot come to the Library when it is open, please address them to the Librarian and leave them at one of the collection points, and please phone the Librarian straight away to say that they are to be collected.

As the Library is primarily to meet the needs of Tutors, Readers are asked to return immediately any book on loan to them which is required by a Tutor.

COLLECTION POINTS

- 1) All Saints' Church, Leamington Spa. Books left with the Church Stewards. Church normally open 9.15a.m. to 5.00p.m., weekdays, and at Service times on Sundays. (Sometimes closed 2.00 - 5.00p.m. on weekdays in winter months.)
- 2) Church House, Palmerston Road, Coventry. Office hours.

Fig 1.

since all our printing is in black and white, textures become very important. Its 'rubber stamp' option (a version of cut-and-paste) is easier to use than a similar option in ARTIST II.

Although the final form of our printed items is almost always an ARTIST II Pagemaker page, I rarely print from within the program. I have extracted the printing code from the program and added some BASIC of my own, to give a multiple copy printing program, because it is far too tedious to select the 'Pagemaker' and then the 'Print Page' option for every copy.

We cannot print satisfactorily on card. My printer will only handle very lightweight card - certainly not tough enough to stand up to being a borrowers' ticket or a catalogue cover. So these items are printed onto

A4 paper, and then copied onto card at the local photocopy shop. This is the only 'professional' printing we use, and since we only need very small numbers at a time the cost is not prohibitive. The price of 2 pieces of A4 card for catalogue covers, with a photocopy on the front one, was 24p.

COVENTRY DIOCESAN READERS' LIBRARY

NAME.....

YOUR LIBRARY MEMBERSHIP NUMBER IS

IT WOULD BE VERY HELPFUL IF YOU WOULD QUOTE IT IN ALL TRANSACTIONS WITH THE LIBRARY

Fig 2.

Peel-off labels are used for book plates and labels, and withdrawal labels. The book plate carries our logo - the Diocesan arms and a Readers' badge, and goes inside the book cover to show that we own it. The label goes on the title page, and is used to insert the book number and the classification numbers. If a book is no longer required and is withdrawn from stock, a withdrawal label is used to cancel the book plate.

All these are printed using my own 'Small is beautiful' program which appeared in the December 1988 Format, and which also carried an illustration of one of our book plates.

The Library simply could not function efficiently without the Spectrum. If we did not have an easily produced printed catalogue, our limited opening hours would make it useless to borrowers. If we did not keep the issue records on computer, there would have to be 'one ticket per book', and a limit to the number of books anyone could take out at a time. And no-one would be able to ring me up at home to check whether a book is 'in

or out' before they travel half-way across the county in the hope of borrowing it. If we did not do our own printing we could not buy nearly as many books as we do, as all our money would be tied up in stationery.

Fig 3.

I feel certain that many clubs, churches and small businesses would be able to use the Spectrum in a similar way to increase their efficiency and reduce their overheads. The computer stores will sneer, and tell you that the Spectrum is a kids' games machine, that you need a PC for serious work. Don't listen to them. A Spectrum, PLUS D, and disc drive with a decent dot matrix printer (not daisy wheel if you want to do printing via screen dumps) will cost no more, and probably a good deal less, than the cheapest so-called 'real' computer, and the savings on software costs are huge.

Fig 4.

If you thought that computerising your business was too expensive or too complicated, take a look at the Spectrum and think again.

THE SAM SPOT

By: Bob Brenchley.

The first batch of Bruce's Mega Chips arrived in the UK during the second week in July. The BMC chip is the large custom array which reduces the chip count in the SAM COUPE to just eight (Z80B CPU, 32K ROM, SAA1099 Sound Chip, TEA2000 Video Encoder, 2 off 256x4 Kilo-Bit RAM chips, MIDI coupler, and Bruce's Mega Chip). These first samples of the BMC, together with more arriving at the end of July, will be used to build development machines so that hardware and software development can move into top gear. The list of software companies who want to work with SAM grows longer every week.

Work on the manuals for the SAM COUPE has now started. A team headed by that well known personality - Mel Croucher - is working on the User manual. Kate Cameron-Daum will be doing the desk-top publishing using a MAC/Linotron combination. Mel (famous for his PI-Man cartoon that used to grace the back-page of Popular Computing Weekly and for his topical columns in several magazine) will be writing the manual which will be enhanced by the innovative use of cartoons created by Robin Evans.

A technical manual, written by Bruce Gordon, is also under way, early drafts have already been sent out to some developers.

Next, very good news for all you computer artists out there. MGT have commissioned top Swedish programmer

Bo Jangeborg (pictured above) to produce a full feature art package for the SAM COUPE. Bo is well known in the Spectrum arena for his excellent programmes ARTIST and ARTIST II. It was originally felt that the package should be made available to help software companies develop graphics for SAM's enhanced screen modes. But, being the generous people that MGT are, and seeking to establish the SAM COUPE in graphic circles (no pun intended) right from the start, MGT have decided to bundle the program with all SAMs from launch.

Finally, a reminder that MGT have the SAM HOTLINE on 0792-791275, a 24 hour recorded news service - updated weekly.

HACK-ZONE

By: Hugh J. McLenaghan.

Hello and welcome to another Hack-Zone. This month I will start off by giving you a list of pokes for Operation Wolf 128K followed by an explanation of how I found these pokes. This should also help you find your own pokes to games. If you have found pokes for any programs then please send them in and I will try to print them in a future Hack-Zone.

Operation Wolf 128K Pokes

40756,183	Inf Grenades
40727,183	Inf Magazines
40722,0	Inf Bullets
40837,0:40838,0	Inf Continues
41150,183:41762,0	Inf Energy
40844,195) Continue
40845,184) without timer
40846,120) appearing

Now for how it was done. I used a PLUS D with PLUS D Hacker by Steve Nutting, this software was reviewed last month. DISCiPLE users can use a Multiface to enter the pokes. Please note that anything following the [sign are my own comments.

First of all I loaded PLUS D Hacker followed by Operation Wolf 128K. When the opening menu came up I pressed the snapshot button followed by number 0 to start up PDH. After a few seconds the menu appeared. The first thing I then did was to press P for pokes, this told me that the return address JP was 31348. I wrote this down and pressed M for menu followed by D for disassemble. For the page number I typed 16 and then N for printer. After typing in the address 31348 the following came up:-

```
31348 LD A,247
31350 IN A,(254)
31352 AND 31
```

```
31354 LD HL,31581 [Base address of
                    keyscan tables
31357 LD DE,12   [Length of each
                    keyscan table
31360 LD BC,254
31363 CP 15
31365 JR Z,31432 [Key '5' pressed
31367 CP 30
31369 JR Z,31395 [Key '1' pressed
31371 ADD HL,DE  [Move on to next
                    keyscan table
31372 CP 29
31374 JR Z,31395 [Key '2' pressed
                    etc.
```

The first two commands read in the half row of keys from 1-5, the next line gets rid of the other bits which are of no use. The remaining value is the status of the keys from 1 to 5. Each number corresponds to a bit of the byte, for each key pressed the bit is reset and for each key not pressed the bit is set, this is the opposite of how you would think it should be.

The next three lines set up registers to hold information about keyscan tables, this is so that you can choose any set of playing keys/joysticks.

The first compare is CP 15 this checks for key '5' pressed and keys 1-4 not pressed, this is the REDEFINE KEYS option, the next line jumps to the routine if the compare is true, ie Z is set.

We want a check for a key which will start the game, ie 1-4. The next compare is CP 30 which is a check for key '1', the following line is JR Z,31395 which means jump to 31395 if the compare was true. The routine at 31395-31428 sets up the keyscan table for your choice of keys, but the command at address 31429, which is

JP 30863, gives us our next disassembly point.

30863 CALL 43697 [Reset all sound registers
30866 CALL 42351 [Clear the screen
30869 LD HL,39606
30872 LD BC,24
30875 CALL 42357 [Clears 39606 to 39606+23
30878 CALL 32577 [Set-up routine

This last line is the important line as calls up the routine to set up the variables, disassembling at 32577 gives us:-

32577 LD A,32 [Bullets per magazine
32579 LD (41612),A
32582 LD HL,1797
32585 LD (39616),HL
32588 RET

This does not look like it sets up the magazines and grenades, but it does. The actual values are in the third line, ie LD HL,1797. This is 33,5,7 in decimal. Next we take the value in the next line, ie 39616 and search for it in the whole program as this is the grenades value store.

To search you must first press M and then S. After you do this it will ask if you want the data to be printed, I usually press N. Next you type 39616 and write down all of the values including page numbers if required. the values given out are:-

31216 [No decrement commands after 39616 command.
32586 [Set-up of grenades value
40750 [Decrement command near (see below)
40813 Check if you have 5 or more grenades
41658 [Makes sure that you have a maximum of 7 grenades.
41667 [Makes sure that you have a maximum of 7 grenades.

After disassembling at 40749 we get:-

40749 LD HL,39616
40752 LD A,(HL) [Get number of grenades
40753 OR A

40754 JR Z,40766 [Jump to 40766 if no grenades
40756 DEC (HL) [reduce number of grenades by 1

So if we poke 40756 with 0 this should stop you from losing any grenades. If you check this you will find that it does stop you from losing grenades.

If you do the same check for 39617 which is where the number of magazines is stored you will get the following numbers:-

40716 [Reduce magazines by 1
40732 [Reduce magazines by 1
41690 [Check of bullets & magazines
41847 [Increase number of magazines
41972 [Check for max of 9 magazines

Disassembling from 40716 we get:-

40715 LD A,(39617)
40718 LD B,A
40719 OR (HL)
40720 JR Z,40744 [Jump if you dont have any bullets or magazines
40722 DEC (HL) [Decrease number of bullets
40723 JP P,40736 [Jump if bullets left
40726 LD A,B
40727 DEC A [Reduce number of magazines
40728 JP M,40744 [Jump if no magazines left
40731 LD (39617),A
40734 LD (HL),32 [Reset number of bullets to 32.

To get infinite magazines you can either poke 40727 with 183 or poke 40722 with zero. One will stop the number of magazines from going down and the other stops the number of bullets from going down.

Well that's it for another month and I hope that you have enjoyed reading it as much as I enjoyed writing it. See you next month.

Hugh J. McLenaghan (Hack-Zone),
36 Floorsburn Crescent, Johnstone,
Renfrewshire, Scotland, PA5 8PF.

INSIDE G+DOS

Part 4.

By: Stephen Warr.

In the issue before last I looked at the PLUS D's disc directory. I thought readers would like a useful machine code routine which adds a new BASIC command CAT [#n;]d1["filename"] where anything inside square brackets is optional (of course the drive number can be 1,2 or *). Note that the form is CAT d1 not the existing CAT 1. The routine produces an alphabetical catalogue and works by reading each directory entry in turn, inserting room at the correct position in a string of previous entries, and transferring only the data needed to produce the final catalogue. Once the end of the directory is reached the whole string of entries is printed out. The catalogue produced is alphabetically (not ASCII) sorted so that "a" is exactly the same as "A", etc.

The routine is designed to be held completely in PLUS D RAM. To get it there you will have to assemble the code to 12628 but actually store it in normal RAM. After assembly save it by:- SAVE d1"alpha"CODE address,295

before loading it back into shadow RAM with:- LOAD d1"alpha"CODE 12628

One point to note is that it was written to work only with the latest version (2a) of G+DOS.

```

When you have it safely in the PLUS D's RAM, set it working with POKE @1154,12628 and then try it out with CAT d1.

In use the routine will be entered with IX already holding 15043 (see above), the optional channel (#n;) has been dealt with and loaded to 15875 (default=2), and the filename has been given a default of "*". There are a number of calls to routines in G+DOS, mostly dealing with syntax checking, but as I think I have run out of space I will explain them next month. Of course you don't need to type in the program comments (given after the line(s) they refer to) so I have not given them line numbers.

For those of you without an assembler I've just managed to squeeze in a Basic poke program. Dont come to rely on this sort of service, I wont always have the space. Besides, working with machine code without an assembler is just asking for headaches.

Back with more PLUS D secrets soon.

YOUR LETTERS

Dear Editor,

When is a disc drive not a 'Lifetime Drive'? I have always been under the impression that the vast majority of drives use the Shugart Standard 34 way edge connector for controlling the drive. My experiences cover TEAC, SEIKO and OLIVETTI drives.

So what makes MGT's new LIFETIME drives so different? Why are they 'Lifetime' and others are not?

Yours Sincerely, Jonathan Butler.

The Shugart Standard refers to the controlling signals not to the cable connections. Atari ST, Amega, BBC, IBM and most other computers use the Shugart signal standard, but each have different cable and connectors at the computer end.

In the past dealers have needed to stock disc drives for all the major computers. This ties up money in large stocks but you can bet your last dollar that the one drive you want will be out of stock. Now the LIFETIME drives have solved the problem. One drive, several cables and external (rear mounted) dip switches to set up the drive's parameters. MGT also provide what must be the best technical manual I've ever seen given away with a drive.

It is true to say that most drives can be fitted to most computers. But it is often beyond the normal users ability to open the drive, change the cable, and then make/break links or work out which switches to alter. Ed.

Dear Editor,

I am writing to FORMAT for two reasons. First an appeal for help in obtaining a copy of the 'Snapshot Compressor' that was advertised by MGT (they no longer stock it).

My second reason is to thank you and all your contributors. My main reason for buying a PLUS D and disc drive had been to save time in loading commercial games, but since joining

INDUG a wider and more useful area of computing has been made easily available to me. My eyes have really been opened by FORMAT. Many thanks.

Yours Sincerely, R.D.Jones.

Dear Editor,

Yes, you were so right when you refer to the BBC's apparent bias. I say "apparent" because I think it is more to do with careless and lazy research.

Maybe you also saw the BBC offering "Memories of a Museum Dog", one of the Omnibus series (transmitted 27/5/89). This attempted to tell the story of gramophones and records from the angle of the famous HMV dog "Nipper". OK, as a Decca recording engineer of some 36 years and having built my own disc-cutting gear in the late '40s, I am in a position to judge the accuracy of such a programme. I expected it to have an HMV slant, and nothing wrong in that, since the theme of Nipper ran through it. But in the event it was so full of inaccuracies and downright untruths that I felt compelled to write to the producers. My letter elicited a reply which tried like hell to justify some of my criticisms and ignored those which it couldn't.

The moral is: don't believe BBC specialised documentaries. The research will be abysmal. The "researchers" will not check any information supplied, and therefore a biased inaccurate account is certain.

Yours Sincerely, Jack Law.

Dear Editor,

Can you print more articles on printers, how they work, what are printer control codes? Which printer is best, etc. Its an area I cant make sense of.

Yours Sincerely, T.S. West.

Letters printed may be edited for length or clarity.

THE SECRETS OF WORD MANAGER

SPECTRUM MACHINE CODE MADE EASY

Part 4.

By: Francis Miles.

ARITHMETIC. - Part 2.

A much more difficult bit of arithmetic is performed by a "Word Manager" subroutine called ENDS. The reason for this subroutine is that "Word Manager" stores text, whether in memory or on tapes, as a continuous string with no indication where the newline comes; when it puts text on screen or prints it out, it makes a newline at the end of every 64 characters (or whatever the current print line length may be).

However, it is sometimes necessary for the program to find the start or end of a line: eg on the command STOP, "Word Manager" has to move the cursor from wherever it is standing to the first character of the current line. If the cursor is on the 17432th character of the text, and the current print line length is 62 characters, the first character of the line will be the 17423th, because $17423 = 281 \times 62 + 1$.

ENDS performs a sum which in BASIC you would write as:-

```
LET HL = LINEP*INT(HL/LINEP)
```

(LINEP is the "Word Manager" system variable holding the selected print line length.) This is a much more difficult sum in machine code than in BASIC, because Z80 assembly language has no direct commands for "multiply" or "divide", let alone finding the INTEger of a number; the subroutine may look pretty cumbersome compared with the BASIC version, but in fact it works a damn sight quicker.

```
5380 ENDS EQU $
5390 ;Move HL (text address) to the
5400 ;end of the previous line.
```

["Text address" merely means HL is counted from "text zero", rather than being a RAM address. I found it necessary to constantly remind myself of this distinction whenever handling an address in the text buffer.]

```
5410 PUSH DE
5420 PUSH BC ; BC/DE
```

[BC and DE are kept on the stack till the end of the subroutine; they're ignored in the notes till the end.]

```
5430 EX DE,HL ;now DE=TA (text
address)
```

[Skip a bit here dealing with the case where TA is in the first line of the text.]

```
5510 ;Stack increasing doubles
5520 ;of LINEP.
5530 INC HL
5540 PUSH HL ; 1
5550 LD HL,(LINEP)
5560 LD H,0
5570 EN.LP PUSH HL ;doubles/1
5580 ADD HL,HL
5590 JR NC,EN.LP
```

[Consider the effect of lines 5510-90 if LINEP is 62. There will be a pile of numbers on the top of the stack, with the biggest at the top:

```
63488
31744
15872
7936
3968
1984
992
496
248
124
62
1
```

Each of these except the bottom two is twice the one below; 1 marks the end of the pile. The next number 126976 doesn't get put on the stack because it's bigger than 65535, so ADD HL,HL (line 5580) produced a carry.]

```
5600 ;Pop one by one and accumulate,
5610 ;not exceeding TA-1.
```

[What I shall do now is take the numbers off the stack and try adding each of them in turn, except the end marker 1, to the accumulator; if the result comes out bigger than TA, that number is discarded, otherwise it's kept. It's a fact, which you can check for yourself if you like, that every multiple of 62 less than 65536 is a sum of some selection of the numbers in this pile; and that you can reach this multiple by following the procedure I describe. This procedure is a variant of what is often called "Russian multiplication". Some form of Russian multiplication is often used for multiplying with Z80 chips - though it is not used by the "floating point calculator".]

```
5620 LD A,1
5630 LD HL,0
```

[A is 1 to check for the end marker; HL is now the accumulator.]

```
5640 EN.LP2 POP BC ;till 1 reached
5650 CP C
5660 ;If C=1 the stack is cleared.
5670 JR Z,EN.RET
5680 ADD HL,BC
5690 JR C,EN.ACG
```

[If adding the latest double makes the accumulator more than 65536, the double must be discarded.]

```
5700 SBC HL,DE ;ACC-TA
5710 JR NC,EN.ACC
```

[If there was no carry, the accumulator is bigger than TA, and the latest double from the stack must be discarded (lines 5760-5780).]

```
5720 ;Accumulator is less than TA.
5730 ADD HL,DE ;HL=ACC again
5740 JR EN.LP2
```

```
5750 ;The accumulator is >= TA.
5760 EN.ACC ADD HL,DE ;HL=ACC again
5770 EN.ACG AND A
5780 SBC HL,BC;ACC-last double
5790 JR EN.LP2
5800 ;HL is now on the end of the
5810 ;previous line.
```

[EN.RET, the exit from the subroutine, is only reached from line 5670, so the stack has been cleared apart from the BC and DE which were put on it at entry.]

```
5820 EN.RET POP BC
5830 POP DE ; -
5840 RET
```

"Russian multiplication" looks completely mad at first sight, but you can make sense of it by thinking in terms of binary arithmetic. The top double on the stack, 63488, is 1024 times 62; 1024 is 100,0000,0000 in binaries. The doubles below it are respectively:- 10,0000,0000B times 1,0000,0000B times 1000,0000B times 100,0000B times ... and so on.

Adding any selection of these numbers gives you a binary number times 62; the procedure in the subroutine gives you 1,0001,1001B times, which is 281 times; and this is the right answer. I suppose this subroutine is really a monument of misplaced ingenuity. If I had used the FP calculator it could have been done like this:-

```
5380 ENDS EQU $
5390 ;Move HL (text address) to end
5400 ;of previous line.
5410 PUSH DE
5420 PUSH BC
5430 ;Put TA on calculator stack.
5440 LD B,H
5450 LD C,L
5460 CALL 11563 ;STACK.BC
```

[The calculator stack is a special stack which the Spectrum keeps in RAM beyond the machine stack (the one you work with PUSH and POP). Unlike the machine stack, numbers put on the calculator stack are five bytes each,

and in "floating point format". There are several ways of putting numbers on the stack, but for integers (positive numbers, not fractions) the simplest are 11563 STACK.BC for two-byte numbers and 11560 STACK.A for one-byte numbers.]

```
5470 ;Put LINEP on calc stack.
5480     LD A,(LINEP)
5490     CALL 11560 ;STACK.A
```

[Now we can use the FP calculator RST 38H, which always works with numbers from the calculator stack - and puts its results on the stack, usually overwriting the top number in doing so. Like the "Word Manager" P.BY subroutines explained in "Printing messages", it works by "popping the return address"; it must be followed by a series of bytes specifying the calculations to be performed, ending with 56, which is called "end-calc". A list of the calculator codes (called "offsets") will be found on page 190 of "The Complete Spectrum ROM Disassembly" - all in hexadecimals.]

```
5500 ;Calculate LINEP*INT(HL/LINEP).
5510 ;Stack holds (from top): LP,TA
5520     RST 38H
5530     DEFB 192 ;st-mem-0 LP,TA
5540 ;Now LINEP is in mem-0.
```

[The calculator also uses a special memory area, 30 bytes starting at 23698. This can hold up to six different numbers in five-byte FP format, in six locations called mem-0, mem-1, ... mem-5.]

```
5550     DEFB 05 ;divide TA/LP
```

["Divide" divides the top of the stack into the next number down. The result is put on the stack replacing both the two numbers - that's why we put LINEP in mem-0, because we want it again in a minute.]

```
5560     DEFB 39 ;int INT(TA/LP)
5570     DEFB 224 ;get-mem-0 LP,INT
5580     DEFB 04 ;multiply LP*INT
```

[Again, the result replaces both numbers on the stack - but we don't care, because this is the answer.]

```
5590     DEFB 56 ;end-calc
5600 ;Get answer from top of stack.
5610     CALL 11682 ;FP.TO.BC
5620     LD H,B
5630     LD L,C
```

[Again, there are several ways of getting a number from the calculator stack. In this case we know the answer is an integer and not too big to go into BC, so 11682 FP.TO.BC will be all right.]

```
5640 ;Finished.
5650     POP BC
5660     POP DE
5670     RET
```

This is obviously quite a few bytes shorter than my fantastic subroutine; why don't I put it in "Word Manager"? Well,

1. I think mine is quicker - the FP calculator's "multiply" and "divide" are rather slow.
2. "Word Manager" sets RAM.TOP as low as possible, to leave plenty of room for text, and some users like to add a little extra BASIC for various purposes. There could well be no room for a calculator stack.
3. I like my routine better!

Arithmetic in machine code is a very broad subject and I have only scraped the surface in these two articles. However I hope I have shown you that its not impossible to include quite complex calculations in your programs.

Next month I will be looking at LOOPS.

Continued from page 6.

excellent, is medieval in terms of the rapidly changing computer era. OMNICALC was conceived when all Spectrums had rubber keys and no-one knew of additional cursor control. Hence, the now customary arrows operates as if you pressed CAPS 5 - 8. In other words cursor keys are only partially effective. To reach the edges of your spreadsheet you will have to revert to using keys 5 through 8. Regrettably the conversion program will not cure this shortcoming.

The last address I have for Microsphere is:-

Microsphere Computer Services Ltd

Flexipage 200

The Viewdata/graphics authoring system for Spectrum 48/128K

SAVE MONEY BY WRITING YOUR OWN EDUCATIONAL PROGRAMS,
DISPLAYS AND GAMES WITHOUT NEEDING ANY PROGRAMMING EXPERIENCE.

For free format or interactive exercises, adventure games, and automatic displays in large text and graphics, with colour, sound, scoring and automatic, named, results print-out.

With full SCREENS picture capability, a graphic set for fast picture / diagram drawing and designer for easy graphics change in fine detail, and FREE 200 STAGE INTERACTIVE DEMO.

Developed from enthusiastic use with all ages at clubs, schools and fetes, Flexipage has been supplied to 11 Police Forces and televised in action for Harlech T.V.'s "Dial 999".

"An impressive authoring system." SPECTRUM DISCOVERY CLUB.
"Numerous applications. A lot of care has been taken." "OUTLET"
"Tremendous potential." "ENGLISH TEACHING WITH COMPUTERS"
"An ingenious system-worked like a dream." "POP.COMPUTING WEEKLY"
"A clever package well presented." "YOUR SINCLAIR"

Tape: £10.50. Disk: 3.5" +1/Opus, 3"+3: £12.50. Full details: SAE Flexibase Software, 20 The Parklands, Droitwich, Worcs. WR9 7DG.

now or send an SAE for catalogue.

Spectrum DTP

PCG's DTP Pack represents a revolution in Spectrum software. Compatible with ALL Spectrums this amazing set of programs drives your Epson-compatible printer to the limit using 12 NLQ fonts. Extra fonts are now available from PCG.

The DTP Pack can be used with cassette, microdrive and disk systems, and with a wide variety of printers. Send now for details and sample prints.

FLEXIPAGE

Reviewed

By: John Wase.

Flexipage is a program written by David Wornham, a police superintendent who has a lot to do with Community Policing. He wanted a way of displaying a screen with simple graphics and a message large enough to be read by a number of people, like "You see someone snatching an old lady's bag - do you"

- a) Ring 999? (127)
- b) Hit him? (128)
- c) Run? (129)

Pressing the number gives the next screen in the sequence, and so on. So he wrote a program which would do this (interactive mode). It would also automatically display a series of screens, to provide, for example, a shop-window advert (automatic mode). And it would also allow an operator to select screens for more complex displays (free format). He called the program "Flexipage".

I reviewed this program some time ago in Popular Computing Weekly (16th March, 1989). Already, it's moved on. For instance, I criticised the instructions which came as two A5 booklets and a lot of odd bits of paper. Now they've been combined into one booklet: I was provided with a

pre-release copy, together with an autorunning 3.5" disc for the PLUS D. The demo program has been changed: it's got a neater intro screen and the menu you first hit has an extra item (Read-only system; not implemented on my disc, though). There are also some other more subtle changes to other features either implemented or on the way, but more of these later.

Flexibase Software
FLEXIPAGE MENU
© 1989 David Wornham

- 1. Crime Quiz: interactive
- 2. Flexipage advert: automatic
- A. Any other Flexipage program
- F. Flexipage Authoring System
- G. Graphics designer
- R. Read Only Flexipage System
- S. Save this menu program
- H. Help: Flexipage Conventions

The basic principles of the Flexipage authoring system are as follows: up to 200 half screens, originally input as 5 lines are displayed double height, so text can easily be read at a distance. The program therefore holds 100 screens, since pairs can be displayed together - pretty good. The last three columns on-screen can contain control codes which are not displayed, but control outputs such as paper or ink colour, pause length for which that screen is shown, warning tone (police beep, telephone warble and three-tone alarm), and score - which it will also print out in a final personalised certificate, since the first thing a Flexipage interactive display does is to demand your name!

There is also a library of graphics to assist with the production of the

rather crude, chunky displays, and you can make as many more as you like using the Flexipage Graphics designer.

With Flexipage Auto. this could be an advertisement for **YOUR** **BUSINESS**

Well, how did it all work? Pretty well on the whole. As I explained in the "Popular" review, the system is a bit tetchy about putting in the crude, chunky, teletext-like graphics which have to be input through a very slow "amend" mode; there is only one large type-size, and there are no fancy rolling or scrolling: the input routines, too, are at times inconsistent. All this is largely due to the compromises the author has had

to make - after all, you can only store about five uncompressed screens as code in a Spectrum - this program gives you a hundred, plus a lot of organisation and flexibility. So with these memory limitations, the author is faced with losing screens if amendments to his original BASIC increase its length (as compiling certainly would).

Author David Wornham tells me that by the time you read this, you will be able to make copies direct to tape or disc via the main menu, and you should be able to get round those chunky graphics - he's almost sorted out routines to grab whole or part screens from any SCREEN\$ you care to put in. This should considerably enhance the graphics possibilities.

So, in summary - a usable and stimulating package - with many uses in education or business. Good value at £10.50, (disc version £2.00 extra) from:-

Flexibase Software, 20, The Parklands, Droitwich, Worcs WR9 7DG.

STEVE'S SOFTWARE

PLUS D HACKER £3.00 for Plus D version 1/1a/2/2a

Advanced Hacking, no other Software can beat the Hacking Power of PDH, not even a similar package costing £16.95p. Plus D Hacker hides itself protected inside Plus D Ram with the help of the Disc which stores 8 Power routines activated by pressing the Snapshot Button. All text is shown in 42 Character mode. Disassemble the full 798 Opcodes including the 102 undocumented codes. See all those Graphics, Sprites with the Picture searcher, includes Extensions to Basic to animate the Sprites. The Registers and values on the Stack all shown which can be altered, as well as entering Pokes with help of the Infinte lives searcher for Game users. There is also a text and block searcher and text lister. Works with extra Memory of the 128K Spectrum, PRinter supported.

PLUS D TOOLKIT £2.50 for Plus D version 2/2a only

Extended Basic Hides it'self inside Plus D Ram using no Spectrum memory or Disc access, it cannot even be destroyed by the reset button. Plus D Toolkit repairs permanently destroyed or unreliable Disc sectors and restores erased files, Tape-Disc, Disc-Disc, Clock and Alarm. Compress Snapshot 48K and 128K files (not even the Multiface can compress as good as my Snap 48K).

PLUS D FILER £2.00 for Plus D version 1/1a/2/2a and DISCIPLE

Massive Random Access Filing Database store 676K!! The Database stores 750 record screens\$, text arranged as 42 characters across by 22 lines, can colour and draw anywhere on screen for tables etc.

COST All the above Software prices shown are for the Manual and Software coding, an extra cost of £1.10 (£2.10 overseas) covers the cost of the Disc, Duplication, Postage and Packaging. The reason for this is to save you money as the Software you need is available on only one Disc. Make cheques payable to MR S.J. NUTTING, 7 NARROW CLOSE, HISTON, CAMBRIDGE, CB4 4XX.

By: Shimon Young.

This routine produces some remarkable screen effects on 128k machines. As detailed in my last article, the 128 has a second screen which can be put to various uses. This program uses it to do a smooth, hi-res colour wipe between pictures.

The principle is the same as the old 48k hi-res colour effects. Every 1/50 of a second, the Spectrum jumps to a routine that carefully waits for the TV to reach a certain scan position on the screen and then changes the colours in the display so it appears to have a colour resolution higher than 8*8.

The timing for these programs has to be very precise. With the 48k, machine code programmers knew that there were 224 T-states per scan line. However, the 128s run slightly faster, so these effects fail to work with old programs, eg. the fancy borders on Paperboy and Starion.

Rather than sitting down and calculating how many T-states were needed on a 128, I settled for trial and error. Any masochists wishing to work out how many are used from my assembly listing may feel free to do so.

The first part of the program is an interrupt and can be used on its own. If you wish to create your own effects with it, you only have to poke 48915 with the number of lines down you want the split to happen at plus 48. Therefore the bottom of the screen is 240 or 192 + 48.

The assembler source code given here is for the Hisoft Gens assembler, you may need to make slight adjustments for your own assembler.

PROGRAM 2 - A DEMO

```

1 REM By: SHIMON YOUNG
2 REM For 128 Spectrums Only.
10 CLEAR 48894: LOAD d*"WIPECODE"CODE
20 POKE 23388,16+7: LOAD d*"Screen 1"
  CODE 49152: REM Select Bank 7 and
  load in screen
25 LOAD d*"Screen 2"SCREEN$: REM loa
  d in normal screen
30 RANDOMIZE USR 48966: REM WIPE DOWN
40 RANDOMIZE USR 48946: REM WIPE UP
50 RANDOMIZE USR 48983: REM BOING!
60 GOTO 30

```

To use the routine there are three entry points as shown in the second BASIC listing. USR 48946 does a wipe upwards, USR 48966 wipes downwards and USR 48983 makes the dividing line bounce off the bottom of the screen. The programs turn on and off the interrupt automatically and change system variable BANKM to the other screen. You can change the program so it loads in screens from tape or microdrive instead.

Have fun!

SPECIFICALLY WRITTEN FOR PLUS D & DISCIPLE

FASTWORD PLUS

Here is a great programme that rejuvenates an old favourite. How often when using TASWORD TWO, have you been stuck for the right word? FASTWORD PLUS offers a complete reference book of words, waiting, ready for use at the press of a key!

This is the Plus D and Disciple Disc version of the successful program FASTWORD, a THESAURUS for the Spectrum. Features include ● Full alphabetical index of over 6,000 words ● A display of almost 600 screens ● Equivalent to a 120,000 word printed Thesaurus ● Sense identification for each word ● Select a word from the index using the first 2 letters and displayed on the screen is an average of 20 synonyms and associated words ● 2 way scrolling index ● Fast response ● Overlays Tasword 2 ● Words can be looked up in the Thesaurus as you are working on a text file in Tasword 2!

Also supplied is a NEW TASWORD 2 BASIC PROGRAM, specially written for Disc drive operation, offering new features such as selective catalogue, Wordcount etc. A CONVERTER program tailors your Tasword 2 code to give any combination of screen colours plus a new highly readable Tasword 2 character set.

Complete with instructions these 4 programs represent amazing value. Supplied on Disc. ONLY **£9.95**

FILE MASTER

At last! A comprehensive DataBase system that is VERY EASY to use. You will never forget the correct keys to press when using FILE MASTER, we guarantee it!

This versatile and powerful program can be used to store virtually any type of data. File Master enables you to create and maintain sophisticated data files, the type normally associated with more expensive computers. For example a file called 'DIARY' could be created. After typing the relevant data, the program can inform you which of your friends have a birthday in the next month, if the TV licence is due and the date of your next dental appointment. Records of money paid into the bank and cheques drawn could also be kept in the diary, and for an up-to-date total you simply press a key! The variety and scope of the files you can create is almost limitless and each file you create can have an infinite number of records (using segmented files).

Send for your FILE MASTER disc today. ONLY **£8.95**

THE ORGANISER

Features include ● Organisation of programs on any disc in any order you wish ● Makes finding programs in the directory much easier ● Selected programs load faster ● Checks for faulty sectors ● Automatic or manual Sector Repair ● Recovers erased files ... PLUS many more features to make file handling and disc 'house-keeping' so much EASIER.

This is what the experts said:-

"The ORGANISER has a very friendly user interface.... it's rare to find a package so easy to use.... brings out the best features in GDOS.... MGT should bundle it with SAM.... value for money...." SID MARTIN in COMPUTER SHOPPER.

"Beautifully constructed and presented.... at £5 a bargain.... worth £10 or more just for the Disc Doctor aspects alone.... clearly to be recommended...."

Dr. JOHN WASE in POPULAR COMPUTING WEEKLY.

The ORGANISER is an essential program for ALL Plus D and Disciple users. Supplied on Cassette. ONLY

£5

DISC MANAGER

THE DISC MANAGER is the most powerful program ever written for the DISCIPLE/PLUS D.

Designed to take advantage of Disc Drive ownership, the Manager keeps track of all the programs on all your discs, ● Storage of up to 27,000 records on one Disc, or 79,920 total. Random File Access. ● Name & Number Discs with fast Autonumber and user pre-defined titles features. No typing in of Data. Press a key and Discs are automatically added to appropriate catalogue. ● Fastest ever M/Code Search. 2 modes - Search and Load or Search and List all occurrences, then select program to load.

● Plus many other unique features. ● Comes with 16 page manual and demonstration catalogues. ● Operates with 48K or 128K Spectrums. Send for the DISC

MANAGER today... and you'll soon wonder how you ever Managed without it! NORMALLY £14.95
